

## CLAIMS

1. A communication system comprising:

5 a call routing equipment;

a base station having a control means;

10 a wireline network connecting said base station to said call routing equipment, said wireline network having caller identification;

said base station control means initiating a call to said call routing equipment and sending an identification number to the call routing

15 equipment; and

said call routing equipment receiving a base station routing number via caller identification and using the base station identification number and routing number to route subsequent calls to said base station.

20

~~2. A communication system comprising:~~

~~an authorization equipment;~~

25 ~~a base station having a processor;~~

~~a wireline network connected to said base station, the connection having an associated telephone number;~~

30 ~~said base station control means initiating a call to said authorization equipment; and~~

~~said authorization equipment receiving said telephone number and determining if said telephone number is in an acceptable range and terminating the communication session if the telephone number is not in an acceptable range.~~

35

3. ~~The communication system according to claim 2 wherein said telephone number is provided via caller identification.~~

5 ~~4. A communication system comprising:~~

an authorization equipment;

a base station having a processor;

10

a wireline network connected to said base station, the connection having an associated subscriber name;

15

said base station control means initiating a call to said associated subscriber name via caller identification; and

20

said authorization equipment receiving said telephone number and determining if said subscriber name is in an acceptable range and terminating the communication session if the subscriber name is not in an acceptable range.

5. A communication system comprising:

25

a base station capable of receiving caller identification information and storing a plurality of call identification messages for transmission; and

30

a device capable of receiving a wireless transmission of one or more caller identification messages from the base station.

35

6. The communication system of claim 5 wherein the device is a radiotelephone.

40

7. The communication system of claim 5 wherein the base station transmits one or more caller identification messages based upon a request signal.

8. The communication system of claim 7 wherein the request signal can be initiated by the device.

9. The communication system of claim 7 wherein the request signal is generated by the base station when the device initially comes within transmission range of the base station.

10. The communication system of claim 8 wherein a user of the device causes the device to initiate the request signal.

11. The communication of claim 8 wherein a telephone ring signal received by the device initiates the request signal.

12. In a communication system, a method for routing calls to a terminal, said communication system comprising a call routing equipment connected to the terminal, the method comprising the steps of:

receiving at the call routing equipment a routing number via caller identification;

sending a identification number from the terminal to the call routing equipment; and

routing subsequent calls for said identification number to said routing number.

13. The method of claim 12 further including the step of determining if the routing number is in an acceptable range and terminating the communication session if the routing number is not in an acceptable range.
